

ABSTRACT

A system for enabling a user to simply and precisely grasp various information on balances occurring in one or more processes. The balance management system comprises a server (100) and is provided with a DB (information management means) (110), information acquiring means (120), information updating means (130), and information providing means (140). The DB (110) manages information on a balance of each balance item and information on a correspondence for each process that a balance of which balance item reflects a balance amount of which process item. The information acquiring means (120) acquires information on a process item and a balance amount corresponding to the process item, from a first terminal corresponding to each process. The information updating means (130) updates the information on the balance of the balance item corresponding to the process item, on the basis of the information on the correspondence managed by the DB (110) and the information on the process item and the balance amount acquired by the information acquiring means (120). The information providing means (140) provides a second terminal (20) with the information on the balance item and the balance for one or more processes managed by the DB (110).
